Project 13: Visual Odometry for Unmanned Aerial Vehicles

Mengyang Li & Hongling Wu

Since the first presentation, we have been working on rebuilding the entire project. So far all the dependencies have been downloaded, but while building the project, there is a small problem. The project required us to use boost1.60, but the latest version of boost is 1.9, and we had a lot of problems installing the older version. This can lead to incompatibility issues with gtsam.

Our timeline has been set up to complete the recurrence of the project by the end of the month, which I think we should be able to accomplish before the end of the month.

In the next seven days, our goal is to continue to follow the instructions of the project author to complete the construction and rebuild of the project, and to understand the logic of the code. This could set us up nicely for where we want to be after December.
